

## Model 6655 Electronic Control Head

The Model 6655 is an electronic control head ideal for controlling two main engines and steering gear on virtually any type of vessel 60' or longer. The two chrome-plated handles have independent 45° bi-directional movement for precision maneuvering and total control. In addition to controlling engine speed and steering, this head can be used to control waterjets, fixed-pitch gearbox-driven propellers and CP propellers.

Depending on your needs, it can also come equipped with a separate panel for station transfer, mode selection or an 8-point alarm system.
